ABLE ASSESS FALLS SCREENING

A simple check. Real peace of mind.

Is the person you love at risk of a fall? One in four adults over 65 falls each year. A single fall can change everything — independence, confidence, health, the ability to stay in the home they love. The good news: falls are not a normal part of aging, and the warning signs can be spotted early. Able Assess is a quick, friendly screening that tells you where your loved one stands — and what to do next.

FOR	SCREENING TIME	WHERE
Families of adults 65+	Under 15 minutes	In the comfort of the home

WHAT IS ABLE ASSESS?

A clinically-validated falls-risk screening, used by trusted care providers.

In under 15 minutes, a caregiver measures four simple things that together predict fall risk with remarkable accuracy: grip strength, chair stand, gait speed, and balance. Your loved one sits, stands, walks a few steps, and squeezes a small device. That's it.

THE FOUR MEASUREMENTS

01 Grip strength

A short squeeze on the hand-held sensor. Grip strength is a powerful proxy for overall muscle health and independence.

02 Chair stand

A seated sit-to-stand test measures the lower-body strength needed to rise from a chair, climb stairs, and recover from a stumble.

03 Gait speed

A short timed walk. Gait speed is one of the strongest single predictors of future falls and loss of independence.

04 Balance

A brief standing-balance task flags the instability that precedes most falls, long before a client or family would notice it.

WHY FAMILIES CHOOSE IT

Simple, fast, trusted, actionable, and private.

01

Simple

No needles. No clinics. No stress. Done in the comfort of the home in about 15 minutes.

02

Fast

Results are ready immediately — no waiting weeks for a specialist report.

03

Trusted

Built on the same measures clinicians and researchers use worldwide, benchmarked against thousands of healthy seniors.

04

Actionable

A clear, personalised report with practical next steps — from simple home changes to a referral to physical therapy or their doctor.

THE REPORT YOU RECEIVE

A clearly written, beautifully presented report — with a plan.

After the screening, you'll see exactly how your loved one compares to healthy adults their age. If anything needs attention, the report flags it — and points you toward the right next step, whether that's a conversation with their doctor, a physical therapy referral, or a home-safety review. When follow-up screenings are done, you'll see progress over time, so you know the plan is working. **Fully HIPAA-compliant** — your loved one's information is protected at every step.

IN THE WORDS OF A FAMILY

Take the guesswork out of caring.

You can't be there every moment. Able Assess gives you something better than worry: facts, early warning, and a plan. It turns a vague fear of "what if they fall?" into a concrete, caring conversation — and helps the person you love stay stronger, safer, and independent for longer.

"For the first time, I felt like I actually understood how my mum was doing — not just how she said she was doing. That number on the page changed the whole conversation with her doctor."
